

AN AI ENABLEMENT WORK SAMPLE

Implementing AI at the firm

An enablement & adoption playbook

How I'd take a practice group from a promising tool to trusted, firmwide practice — a reusable method, adapted per tool and team.

Alex Donnelly · AI Enablement Specialist application

Access is easy. Adoption is the work.

Turning on a tool changes nothing. The enablement loop is what turns a capability into daily practice.

My focus is the whole loop — but especially adoption. A tool only creates value once people actually use it, safely, every day.

Align the three sponsors who decide whether adoption sticks

Adoption fails when it depends on one training session. Align the people who own outcomes, workflows, and learning first.

A 90-day pilot-to-rollout — proof before scale

Start narrow, prove it on real work, then widen on evidence. The same arc, reused per tool and team.

A firm is not one audience

Role-based enablement, sequenced by frequency and stakes — so confidence rises before complexity does.

Paralegals & staff

High-frequency, clear before/after: document review, summarizing, first-pass research. Fast wins that build trust.

Associates

Drafting, research, and analysis tied to real matters — with the verify-against-source habit built in from day one.

Partners

Strategic value, risk, and client-facing use. Short, high-signal sessions; the confidence to sponsor and to guide teams.

Delivery mix: live workshops · self-serve modules · microlearning · office hours · a searchable prompt & use-case library.

Champions turn one-to-one into firmwide

One specialist can't be high-touch everywhere. Champions extend the motion; I equip and orchestrate them.

What the champion does

- Localizes the tool to their group's real matters.
- Models the workflow and coaches verification peer-to-peer.
- Surfaces stalls and wins early — the early-warning network.
- Carries momentum between my touches.

What I provide, once, for everyone

- Reusable playbooks, prompt libraries, and use-case templates.
- Enablement content and knowledge checks they can run.
- Communications and adoption campaigns, productized.
- A scorecard so every team is measured the same way.

Responsible use, built in — because that's what earns daily use

Lawyers adopt a tool they trust. The habits that protect the firm are the same habits that drive confident, repeat use.

Confidentiality first

Clear rules on what goes in, matched to the firm's obligations and client expectations.

Human-in-the-loop

Attorneys own the output. AI accelerates the work; judgment and review stay with the lawyer.

Verify against source

Check answers against the record before reliance — rehearsed until it's automatic, not optional.

Know the limits

Coach where the tool is strong and where it isn't, so trust is calibrated and durable.

The adoption scorecard I'd run every rollout against

Agreed with the sponsor at kickoff. Baselines and targets shown are illustrative — set per team.

Success isn't software access. It's verifiable, high-stakes legal work getting done with AI every day.

Evaluate before you scale

Not every promising tool earns a rollout. A bounded evaluation protects attorney time and the firm's trust.

How I'd evaluate a tool

- Test against real, representative matters — not vendor demos.
- Score value, accuracy, and fit to actual workflows.
- Check security, confidentiality, and data handling.
- Run a bounded pilot / proof-of-concept before committing.

What the pilot has to answer

- Did it save real time on real work?
- Is the output reliable and checkable?
- Will practitioners actually use it?
- Does it scale without added risk?

THE OUTCOME

Technology that becomes practice

Adoption that sustains

Value proven every cycle keeps the tool in daily use, not shelfware.

A repeatable method

The same evaluate–pilot–roll out–adopt loop travels to the next tool and team.

A firm that compounds

Each rollout builds the playbooks, champions, and trust that make the next one faster.
